## **A. Data Use Agreement**

Individual identifiers have been removed from the micro-data contained in these files. Nevertheless, under sections 308 (d) and 903 (c) of the Public Health Service Act (42 U.S.C. 242m and 42 U.S.C. 299 a-1), data collected by the Agency for Healthcare Research and Quality (AHRQ) and/or the National Center for Health Statistics (NCHS) may not be used for any purpose other than for the purpose for which they were supplied; any effort to determine the identity of any reported cases is prohibited by law.

Therefore in accordance with the above referenced Federal Statute, it is understood that:

1. No one is to use the data in this data set in any way except for statistical reporting and analysis; and
2. If the identity of any person or establishment should be discovered inadvertently, then (a) no use will be made of this knowledge, (b) the Director Office of Management AHRQ will be advised of this incident, (c) the information that would identify any individual or establishment will be safeguarded or destroyed, as requested by AHRQ, and (d) no one else will be informed of the discovered identity; and
3. No one will attempt to link this data set with individually identifiable records from any data sets other than the Medical Expenditure Panel Survey or the National Health Interview Survey.

By using these data you signify your agreement to comply with the above stated statutorily based requirements with the knowledge that deliberately making a false statement in any matter within the jurisdiction of any department or agency of the Federal Government violates Title 18 part 1 Chapter 47 Section 1001 and is punishable by a fine of up to \$10,000 or up to 5 years in prison.

The Agency for Healthcare Research and Quality requests that users cite AHRQ and the Medical Expenditure Panel Survey as the data source in any publications or research based upon these data.

## **B. Background**

### **1.0 Household Component**

The Medical Expenditure Panel Survey (MEPS) provides nationally representative estimates of health care use, expenditures, sources of payment, and health insurance coverage for the U.S. civilian noninstitutionalized population. The MEPS Household Component (HC) also provides estimates of respondents' health status, demographic and socio-economic characteristics, employment, access to care, and satisfaction with health care. Estimates can be produced for individuals, families, and selected population subgroups. The panel design of the survey, which includes 5 Rounds of interviews covering 2 full calendar years, provides data for examining person level changes in selected variables such as expenditures, health insurance coverage, and health status. Using computer assisted personal interviewing (CAPI) technology, information about each household member is collected, and the survey builds on this information from interview to interview. All data for a sampled household are reported by a single household respondent.

The MEPS-HC was initiated in 1996. Each year a new panel of sample households is selected. Because the data collected are comparable to those from earlier medical expenditure surveys conducted in 1977 and 1987, it is possible to analyze long-term trends. Each annual MEPS-HC sample size is about 15,000 households. Data can be analyzed at either the person or event level. Data must be weighted to produce national estimates.

The set of households selected for each panel of the MEPS HC is a subsample of households participating in the previous year's National Health Interview Survey (NHIS) conducted by the National Center for Health Statistics. The NHIS sampling frame provides a nationally representative sample of the U.S. civilian noninstitutionalized population and reflects an oversample of Blacks and Hispanics. In 2006, the NHIS implemented a new sample design, which included Asian persons in addition to households with Black and Hispanic persons in the oversampling of minority populations. The linkage of the MEPS to the previous year's NHIS provides additional data for longitudinal analytic purposes.

### **2.0 Medical Provider Component**

Upon completion of the household CAPI interview and obtaining permission from the household survey respondents, a sample of medical providers are contacted by telephone to obtain information that household respondents can not accurately provide. This part of the MEPS is called the Medical Provider Component (MPC) and information is collected on dates of visit, diagnosis and procedure codes, charges and payments. The Pharmacy Component (PC), a subcomponent of the MPC, does not collect charges or diagnosis and procedure codes but does collect drug detail information, including National Drug Code (NDC) and medicine name, as well as date filled and sources and amounts of payment. The MPC is not designed to yield national estimates. It is primarily used as an imputation source to supplement/replace household reported expenditure information.

### **3.0 Survey Management and Data Collection**

MEPS HC and MPC data are collected under the authority of the Public Health Service Act. Data are collected under contract with Westat, Inc. (MEPS HC) and Research Triangle Institute (MEPS MPC). Data sets and summary statistics are edited and published in accordance with the confidentiality provisions of the Public Health Service Act and the Privacy Act. The National Center for Health statistics (NCHS) provides consultation and technical assistance.

As soon as data collection and editing are completed, the MEPS survey data are released to the public in staged releases of summary reports, micro data files, and tables via the MEPS Web site: [meps.ahrq.gov](http://meps.ahrq.gov). Selected data can be analyzed through MEPSnet, an on-line interactive tool designed to give data users the capability to statistically analyze MEPS data in a menu-driven environment.

Additional information on MEPS is available from the MEPS project manager or the MEPS public use data manager at the Center for Financing, Access, and Cost Trends, Agency for Healthcare Research and Quality, 5600 Fishers Lane, Rockville, MD 20857 (301-427-1406).

## C. Technical and Programming Information

### 1.0 General Information

This documentation describes the data contained in MEPS Public Use Release HC-170, which is one in a series of public use data files to be released from the 2014 Medical Expenditure Panel Survey Household Component (MEPS HC). Released in ASCII (with related SAS, SPSS, and Stata programming statements and data user information) and SAS formats, this public use file provides information on household-reported medical conditions collected on a nationally representative sample of the civilian noninstitutionalized population of the United States for calendar year 2014 MEPS HC. The file contains 27 variables and has a logical record length of 87 with an additional 2-byte carriage return/line feed at the end of each record.

This documentation offers a brief overview of the types and levels of data provided and the content and structure of the files. It contains the following sections:

- Data File Information
- Survey Sample Information
- Merging/Linking MEPS Data Files
- Appendices
  - Variable-Source Crosswalk
  - Detailed ICD-9-CM Condition, Procedure, and Clinical Classification Code Frequencies
  - Clinical Classification Code to ICD-9-CM Code Crosswalk
  - List of Invalid ICD-9-CM Codes
  - List of Conditions Asked in Priority Conditions Enumeration Section

A codebook of all the variables included in the 2014 Medical Conditions File is provided in an accompanying file.

For more information on MEPS survey design, see T. Ezzati-Rice, et al., 1998-2007 and S. Cohen, 1996. A copy of the survey instrument used to collect the information on this file is available on the MEPS Website: [meps.ahrq.gov](http://meps.ahrq.gov).

### 2.0 Data File Information

This file contains 116,679 records. Each record represents one medical condition reported for a household survey member who resides in an eligible responding household and who has a positive person or family weight.

Conditions created in the Priority Condition Enumeration (PE) section were asked in the context of “has person ever been told by a doctor or other health care professional that they have (condition)?” except joint pain and chronic bronchitis, which ask only about the last 12 months. If the response is Yes (1), then a condition record is generated but only included in this file if the condition is *current*. A condition is defined as *current* if it is linked to an event or a condition the person is currently experiencing (i.e., a condition selected in the Condition Enumeration (CE) section).

Records meeting one of the following criteria are included on the file:

In Panel 19:

- Round 1 and Round 2 records that are current conditions. A current condition is defined as a condition linked to a 2014 event or a condition the person is currently experiencing (i.e., a condition selected in the CE section);
- Round 3 conditions that were linked to a 2014 event;
- Round 3 conditions that were due to an accident or injury;
- Round 3 priority condition records that are current and the age of diagnosis is less than or equal to the person's age as of 12/31/2014, the age of diagnosis is refused, don't know, or not ascertained, or the age of diagnosis is set to -1 (inapplicable; for all cancer conditions); or
- Round 3 conditions where 50 percent or more of person's reference period occurred in 2014.

In Panel 18:

- Round 3, Round 4, and Round 5 records that are current conditions. A current condition is defined as a condition linked to a 2014 event or a condition the person is currently experiencing (i.e., a condition selected in the CE section); or
- Round 1 and Round 2 condition records that are linked to a 2014 event or a condition the person is currently experiencing in 2014 (i.e., a condition selected in the CE section).

For most variables on the file, the codebook provides both weighted and unweighted frequencies. The exceptions to this are weight variables and variance estimation variables. Only unweighted frequencies of these variables are included in the accompanying codebook file. See the Weights Variables list in Appendix 1, Variable-Source Crosswalk.

Data from this file can be merged with 2014 MEPS person-level data to append person-level characteristics such as demographic or health insurance characteristics to each record by using DUPERSID (see Section 4.0 for details). Since each record represents a single condition reported by a household respondent, some household members may have multiple medical conditions and thus will be represented by multiple records on this file. Other household members may have had no reported medical conditions and thus will have no records on this file. Still other household members may have had a reported medical condition that did not meet the criteria above and thus will have no records on this file. Data from this file also can be merged to 2014 MEPS Event Files (HC-168A, and HC-168D through HC-168H) by using the link files provided in HC-168I. (See HC-168I documentation for details.)

## **2.1 Codebook Structure**

The codebook and data file list variables in the following order:

Unique person identifiers  
Unique condition identifiers

Medical condition variables  
 Utilization variables  
 Weight and variance estimation variables

Note that the person identifier is unique within this data year.

## 2.2 Reserved Codes

The following reserved code values are used:

Value	Definition
-1 INAPPLICABLE	Question was not asked due to skip pattern
-7 REFUSED	Question was asked and respondent refused to answer question
-8 DK	Question was asked and respondent did not know answer
-9 NOT ASCERTAINED	Interviewer did not record the data

## 2.3 Codebook Format

This codebook describes an ASCII data set and provides the following programming identifiers for each variable:

Identifier	Description
Name	Variable name (maximum of 8 characters)
Description	Variable descriptor (maximum 40 characters)
Format	Number of bytes
Type	Type of data: numeric (indicated by NUM) or character (indicated by CHAR)
Start	Beginning column position of variable in record
End	Ending column position of variable in record

## 2.4 Variable Naming

In general, variable names reflect the content of the variable, with an 8-character limitation. Edited variables end in an “X” and are so noted in the variable label. (CONDIDX, which is an encrypted identifier variable, also ends in an “X”.)

Variables contained in this delivery were derived either from the questionnaire itself or from the CAPI. The source of each variable is identified in Appendix 1 “Variable-Source Crosswalk.” Sources for each variable are indicated in one of three ways: (1) variables derived from CAPI or assigned in sampling are so indicated; (2) variables collected at one or more specific questions have those numbers and questionnaire sections indicated in the “SOURCE” column; and (3) variables constructed from multiple questions using complex algorithms are labeled “Constructed” in the “SOURCE” column.

## **2.5 File Contents**

### **2.5.1 Identifier Variables (DUID-CONDRN)**

The definitions of Dwelling Units (DUs) in the MEPS HC are generally consistent with the definitions employed for the National Health Interview Survey (NHIS). The dwelling unit ID (DUID) is a 5-digit random number assigned after the case was sampled for MEPS. The person number (PID) uniquely identifies each person within the dwelling unit.

The variable DUPERSID uniquely identifies each person represented on the file and is the combination of the variables DUID and PID.

CONDN is the condition number and uniquely identifies each condition reported for an individual. The range on this file for CONDN is 11-631 and the range of total records for any one person on the file is 1-61.

The variable CONDIDX uniquely identifies each condition (i.e., each record on the file) and is the combination of DUPERSID and CONDN. CONDIDX is always a length of 12 with DUPERSID (8) and CONDN (4), with leading zeros added if needed) combined. For CONDIDX, the condition number is padded with leading zeroes to ensure consistent length.

PANEL is a constructed variable used to specify the panel number for the interview in which the condition was reported. PANEL will indicate either Panel 18 or Panel 19.

CONDRN indicates the round in which the condition was first reported. For a small number of cases, conditions that actually began in an earlier round were not reported by respondents until subsequent rounds of data collection. During file construction, editing was performed for these cases in order to reconcile the round in which a condition began and the round in which the condition was first reported.

### **2.5.2 Medical Condition Variables (AGEDIAG-CCCODEX)**

This file contains variables describing medical conditions reported by respondents in several sections of the MEPS questionnaire, including the Condition Enumeration section, all questionnaire sections collecting information about health provider visits, and prescription medications (see Variable-Source Crosswalk in Appendix 1 for details).

#### **2.5.2.1 Priority Conditions and Injuries**

Certain conditions were *a priori* designated as “priority conditions” due to their prevalence, expense, or relevance to policy. Some of these are long-term, life-threatening conditions, such as cancer, diabetes, emphysema, high cholesterol, hypertension, ischemic heart disease, and stroke. Others are chronic manageable conditions, including arthritis and asthma. The only mental health condition on the priority conditions list is attention deficit hyperactivity disorder/attention deficit disorder.

When a condition was first mentioned, respondents were asked whether it was due to an accident or injury (INJURY=1). Only non-priority conditions (i.e., conditions reported in a section other

than PE) are eligible to be injuries. The interviewer is prevented from selecting priority conditions as injuries.

### **2.5.2.2 Age Priority Condition Began**

The age of diagnosis (AGEDIAG) was collected for all priority conditions, except joint pain. Beginning in FY 2013, for confidentiality reasons, AGEDIAG is set to Inapplicable (-1) for cancer conditions.

To ensure confidentiality, age of diagnosis was top-coded to 85. This corresponds with the age top-coding in person-level PUFs.

Beginning in 2013, the day, month, and year an accident or injury occurred (ACCDENTD, ACCDENTM, and ACCDENTY) and whether the accident or injury occurred before or after January 1 (ACCDNJAN) of the reference year when ACCDENTY is refused, don't know, or not ascertained, were dropped from the MEPS interview and are no longer collected.

### **2.5.2.3 Follow-up Questions for Injuries and Priority Conditions**

When a respondent reported that a condition resulted from an accident or injury (INJURY=1), respondents were asked during the round in which the injury was first reported whether the accident/injury occurred at work (ACCDNWRK). This question was not asked about persons aged 15 and younger; the condition had ACCDNWRK coded to inapplicable (-1) for those persons.

For cancer conditions collected in the PE section, a follow-up question was asked when the cancer was first reported to determine whether the cancer was in remission/under control (REMISSN). Beginning in FY 2013, REMISSN was removed from the file for confidentiality purposes.

### **2.5.2.4 Sources for Conditions on the MEPS Conditions File**

The records on this file correspond with medical condition records collected by CAPI and stored on a person's MEPS conditions roster. Conditions can be added to the MEPS conditions roster in several ways. A condition can be reported in the Priority Condition Enumeration (PE) section in which persons are asked if they have been diagnosed with specific conditions. The condition can be identified as the reason reported by the household respondent for a particular medical event (hospital stay, outpatient visit, emergency room visit, home health episode, prescribed medication purchase, or medical provider visit). Finally, the condition may be reported by the household-level respondent as a condition "bothering" the person during the reference period (see question CE03). Conditions reported in the PE section that are not current are not included on this file.

### **2.5.2.5 Treatment of Data from Rounds Not Occurring in 2014**

Prior to the 2008 file, priority conditions reported during Rounds 1 and 2 of the second year panel were included on the file even if the conditions were not related to an event or reported as a serious condition occurring in the second year of the panel. Beginning in 2008, priority

conditions are included on the file only if they are current conditions. A current condition is defined as a condition linked to an event or a condition the person is currently experiencing (i.e., a condition selected in the Condition Enumeration (CE) section). Conditions from Rounds 1 and 2 that are not included in the 2014 file are available in the 2013 Medical Conditions File. Note that, for some Rounds 1 and 2 records, data may not be available on the previous year's file. This situation can occur when a person does not have a positive person or family weight in the first year but is assigned a positive weight in the subsequent year. The situation can also occur if the condition is a priority condition for which no events were reported in the first year but are reported in the second year. For 2014, 93 conditions from Panel 18 Rounds 1 and 2 are included on the 2014 Medical Conditions File for persons who did not appear on the previous year's file.

Note: Priority conditions are generally chronic conditions. Even though a person may not have reported an event in 2014 due to the condition, or reported generally experiencing the condition in 2014, analysts should consider that the person is probably still experiencing the condition. If a Panel 18 person reported a priority condition in Round 1 or 2 and did not have an event for the condition in Round 3, 4, or 5, the condition will not be included on the 2014 Medical Conditions File.

#### **2.5.2.6 Rounds in Which Conditions Were Reported/Selected (CRND1 – CRND5)**

A set of constructed variables indicates the round in which the condition was first reported (CONDRN), and the subsequent round(s) in which the condition was selected (CRND1 – CRND5). The condition may be reported or selected when the person reports an event that occurred due to the condition, or the condition may be selected as a serious condition that is not linked to any events. For example, consider a condition for which CRND1 = 0, CRND2 = 1, and CRND3 = 1. For non-priority conditions, this sequence of CRND indicators on a condition record implies that the condition was not present during Round 1 (CRND1 = 0), was first mentioned during Round 2, and was selected during Round 3. For priority conditions, it is necessary to look at CONDRN rather than CRND# to determine in which round the condition was first reported. In addition to the scenario above, this sequence of CRND indicators may imply for priority conditions that the condition was reported in the PE section in Round 1 but was not connected with an event, and not selected in the CE section as a current condition until Rounds 2 and 3.

#### **2.5.2.7 Disability Flag Variables**

Beginning in 2013, three Disability Days variables indicating whether a condition is associated with a missed work day (WRKINBED), a missed school day (SCLINBED), or a day spent in bed (DDBEDAYS) were dropped from the MEPS interview. Consequently, the corresponding Conditions file variables, MISSWORK, MISSSCHL, and INBEDFLG, were dropped from this file.

#### **2.5.2.8 Diagnosis, Condition, and Procedure Codes**

The medical conditions and procedures reported by the Household Component respondent were recorded by the interviewer as verbatim text, which was then coded by professional coders to fully-specified ICD-9-CM codes, including medical condition and V codes (see Health Care

Financing Administration, 1980). Although codes were verified and error rates did not exceed 2 percent, analysts should not presume this level of precision in the data; the ability of household respondents to report condition data that can be coded accurately should not be assumed (see Cox and Iachan, 1987; Edwards, et al, 1994; and Johnson and Sanchez, 1993). Some condition information is collected in the Medical Provider Component of MEPS. However, since it is not available for everyone in the sample, it is not used to supplement, replace, or verify household-reported condition data.

Data analysts should also use caution when working with the procedure codes on this file. Procedure codes are gathered in the same manner as the conditions data, i.e., reports by household respondents. The survey does not prompt respondents for procedures, so procedures are under-reported. In addition, the ability of household respondents to accurately report procedures should not be assumed. Analysts should not use available data on procedures to make estimates of frequencies of specific procedures or to extrapolate to national estimates.

Professional coders followed specific guidelines in coding missing values to the ICD-9-CM diagnosis condition and procedure variables. The ICD-9-CM diagnosis condition variable (ICD9CODX) was coded -9 where the verbatim text fell into one of three categories: (1) the text indicated that the condition was unknown (e.g., DK); (2) the text indicated the condition could not be diagnosed by a doctor (e.g., doctor doesn't know); or (3) the specified condition was not codeable and a procedure could not be discerned from the text. ICD9CODX was coded -1 where the verbatim text strictly denoted a procedure and not a condition. The ICD-9-CM procedure variable (ICD9PROX) was coded -9 where the verbatim text strictly denoted a procedure, but the text was not specific enough to assign a procedure code. ICD9PROX was set to -1 where the text strictly specified a condition and not a procedure.

In order to preserve confidentiality, nearly all of the diagnosis condition codes provided on this file have been collapsed from fully-specified codes to 3-digit code categories. Table 1 in Appendix 2 provides unweighted and weighted frequencies for all ICD-9-CM condition code values reported on the file. In this table, values that reflect this collapsing have an asterisk in the label indicating that the 3-digit category includes all the subclassifications within that category. For example, the ICD9CODX value of 034 "Strep Throat/Scarlet Fev \*" includes the fully-specified subclassifications 034.0 and 034.1; the value 296 "Affective Psychoses\*" includes the fully-specified subclassifications 296.0 through 296.99. Approximately 9 percent of the records on this file were edited further by collapsing two or more 3-digit codes into one 3-digit code. Some values of ICD9CODX may have been recoded to Not Ascertained (-9) for confidentiality reasons.

Beginning with the FY12 Conditions file, for confidentiality purposes, ICD-9-CM codes are recoded to broader codes by clinicians for conditions that occur fewer than 20 times within a year's conditions file and for clinically rare conditions. A condition is deemed clinically rare if it appears on the National Institutes of Health's list of rare diseases. Each year, a few conditions on the final file fall below the confidentiality threshold. This is due to the multistage file development process. The confidentiality recoding is performed on the preliminary version of the Conditions file each year. This preliminary version is used in the development of other event PUFs and, in turn, these event PUFs are used in the development of the final conditions file.

During this process, some records from the preliminary file are dropped because only records that are relevant to the current data year are reflected in the final Conditions PUF.

Most of the procedure codes were collapsed from fully-specified codes to 2-digit category codes. Table 2 in Appendix 2 provides unweighted and weighted frequencies for ICD9PROX, and this type of collapsing is identified by an asterisk in the variable label. For example, the ICD9PROX value of 81 “Joint Repair\*” includes subclassifications 81.0 through 81.99. Less than 1 percent of records were further edited to combine two or more 2-digit categories.

Note that, through FY 2012, for conditions related to certain medical events, the ICD-9-CM codes on this file were also released in the Prescribed Medicines, Emergency Room Visits, Office-based Medical Provider Visits, Outpatient Department Visits, and Inpatient Hospital Stays Event Files. Because the ICD-9-CM codes have been collapsed, it is possible for there to be duplicate ICD-9-CM condition or procedure codes linked to a single medical event when different fully-specified codes are collapsed into the same code. For information on merging data on this file with the 2014 MEPS Event Files (HC-168A, and HC-168D through HC-168H) refer to the link files provided in HC-168I, and see HC-168I documentation for details.

Each year certain ICD-9-CM codes are ‘retired’ from use. Beginning in 2012, these codes are removed from the ‘history’ table (Appendix 3) prior to condition coding processing and listed separately for reference (see List of Invalid ICD-9-CM Codes in Appendix 4).

In a small number of cases, diagnosis, condition, and procedure codes were further recoded to -9 if they denoted a pregnancy for a person younger than 16 or older than 44. There were 9 records recoded in this manner on the 2014 Medical Conditions File. The person’s age was determined by linking the 2014 Medical Conditions File to the 2013 and 2014 Person-Level Use PUFs. If the person’s age is under 16 or over 44 in the round in which the condition or procedure was reported, the appropriate condition or procedure code was recoded to -9.

Users should note that because of the design of the survey, most deliveries (i.e., births) are coded as pregnancies. For more accurate estimates for deliveries, analysts should use RSNINHOS “Reason Entered Hospital” found on the Hospital Inpatient Stays Public Use File (HC-168D).

Conditions and procedures were reported in the same sections of the HC questionnaire (see Variable-Source Crosswalk in Appendix 1). Labels for all values of the variables ICD9CODX and ICD9PROX, as shown in Tables 1 and 2, are provided in the SAS programming statements included in this release (see the H170SU.TXT file).

### **2.5.2.9 Clinical Classification Codes**

ICD-9-CM condition codes have been aggregated into clinically meaningful categories that group similar conditions (CCCODEX). CCCODEX was generated using Clinical Classification Software (formerly known as Clinical Classifications for Health Care Policy Research (CCHPR)), which aggregates conditions and V-codes into mutually exclusive categories, most of which are clinically homogeneous (Elixhauser, et al, 2000). Appendix 3 lists the ICD-9-CM codes that have been aggregated for each clinical classification category.

The reported ICD-9-CM condition code values were mapped to the appropriate clinical classification category prior to being collapsed to 3-digit ICD-9-CM condition codes. The result is that every record which has an ICD-9-CM diagnosis code also has a clinical classification code.

For confidentiality purposes, ICD-9-CM codes are recoded to broader codes by clinicians for conditions that occur fewer than 20 times within a year's conditions file and for clinically rare conditions.

CCS codes are assigned to the original fully-specified ICD-9-CM codes. When the original ICD-9-CM codes undergo recoding, no changes are made to the assigned CCS codes.

As with ICD9CODX and ICD9PROX, professional coders followed specific guidelines in setting CCCODEX to a missing value. CCCODEX was coded -9 where the verbatim text fell into one of three categories: (1) the text indicated that the condition was unknown (e.g., DK); (2) the text indicated the condition could not be diagnosed by a doctor (e.g., doctor doesn't know); or (3) the specified condition was not codeable and a procedure could not be discerned from the text. CCCODEX was coded -1 where the verbatim text strictly denotes a procedure and not a condition.

A small number (less than 1 percent) of clinical classification codes have been edited for confidentiality purposes. Table 3 in Appendix 2 provides weighted and unweighted frequencies for CCCODEX. Labels for all values of the variable CCCODEX, as shown in Table 3, are provided in the SAS programming statements included in this release (see the H170SU.TXT file).

In a small number of cases, clinical classification codes were further recoded to -9 if they denoted a pregnancy for a person younger than 16 or older than 44. There were 9 records recoded in this manner on the 2014 Medical Conditions File. The person's age was determined by linking the 2014 Medical Conditions File to the 2013 and 2014 Person-Level Use PUFs. If the person's age is under 16 or over 44 in the round in which the condition was reported, the appropriate clinical classification code was recoded to -9.

Note that, prior to 2004 the range for the variable CCCODEX was 001 through 260. In 2004, revisions to the coding of mental disorders were implemented. The codes 650 through 663 replaced 065 through 075 in 2004. Beginning in 2007, the mental disorders codes were reorganized again. Alcohol and substance abuse disorders were broken into separate categories, and miscellaneous mental disorders were renumbered.

Analysts should use the clinical classification codes listed in the Conditions PUF document (HC-170) and the Appendix to the Event Files document (HC-168I) when analyzing MEPS conditions data. Although there is a list of clinical classification codes and labels on the Healthcare Cost and Utilization Project (HCUP) Website, if updates to these codes and/or labels are made on the HCUP Website after the release of the 2014 MEPS PUFs, these updates will not be reflected in the 2014 MEPS data.

### **2.5.3 Utilization Variables (OBNUM – RXNUM)**

The variables OBNUM, OPNUM, HHNUM, IPNUM, ERNUM, and RXNUM indicate the total number of 2014 events that can be linked to each condition record on the current file, i.e., office-based, outpatient, home health, inpatient hospital stays, emergency room visits, and prescribed medicines, respectively.

These counts of events were derived from Expenditure Event Public Use Files (HC-168G, HC-168F, HC-168H, HC-168D, HC-168E, and HC-168A). Events associated with conditions include all utilization that occurred between January 1, 2014 and December 31, 2014.

Because persons can be seen for more than one condition per visit, these frequencies will not match the person or event-level utilization counts. For example, if a person had one inpatient hospital stay and was treated for a fractured hip, a fractured shoulder, and a concussion, each of these conditions has a unique record in this file and IPNUM=1 for each record. By summing IPNUM for these records, the total inpatient hospital stays would be three when actually there was only one inpatient hospital stay for that person and three conditions were treated. These variables are useful for determining the number of inpatient hospital stays for head injuries, hip fractures, etc.

## **3.0 Survey Sample Information**

### **3.1 Overview**

There is a single full year person-level weight (PERWT14F) assigned to each record for each key, in-scope person who responded to MEPS for the full period of time that he or she was in-scope during 2014. A key person was either a member of a responding NHIS household at the time of the interview or joined a family associated with such a household after being out-of-scope at the time of the NHIS (the latter circumstance includes newborns as well as those returning from military service, an institution, or residence in a foreign country). A person is in-scope whenever he or she is a member of the civilian noninstitutionalized portion of the U.S. population.

There has been an important change in the MEPS sample design that is worth noting. A new NHIS sample design was implemented in 2006 with a new sample of PSUs and segments, independent of the sample design used from 1995-2005. To the extent that the new NHIS design provides better coverage of the civilian noninstitutionalized U.S. population in general and specific subgroups in particular, differences between estimates based on the old and new designs could arise in both the NHIS and MEPS due to such improved coverage rather than actual changes in the characteristics of the target population.

### **3.2 Details on Person Weight Construction**

The person-level weight PERWT14F was developed in several stages. First, person-level weights for Panel 18 and Panel 19 were created separately. The weighting process for each panel included adjustments for nonresponse over time and calibration to independent population totals. The calibration was initially accomplished separately for each panel by raking the corresponding sample weights to Current Population Survey (CPS) population estimates based on five

variables. The five variables used in the establishment of the initial person-level control figures were: census region (Northeast, Midwest, South, West); MSA status (MSA, non-MSA); race/ethnicity (Hispanic; Black, non-Hispanic; Asian, non-Hispanic; and other); sex; and age. A 2014 composite weight was then formed by multiplying each weight from Panel 18 by the factor .50 and each weight from Panel 19 by the factor .50. Control totals were established using poverty status (five categories: below poverty, from 100 to 125 percent of poverty, from 125 to 200 percent of poverty, from 200 to 400 percent of poverty, at least 400 percent of poverty) as well as the other five variables previously used in the weight calibration.

### **3.2.1 MEPS Panel 18 Weight Development Process**

The person-level weight for MEPS Panel 18 was developed using the 2013 full year weight for an individual as a “base” weight for survey participants present in 2013. For key, in-scope members who joined an RU some time in 2014 after being out-of-scope in 2013, the initially assigned person-level weight was the corresponding 2013 family weight. The weighting process included an adjustment for person-level nonresponse over Rounds 4 and 5 as well as raking to population control figures for December 2014 for key, responding persons in-scope on December 31, 2014. These control figures were derived by scaling back the population distribution obtained from the March 2015 CPS to reflect the December 31, 2014 estimated population total (estimated based on Census projections for January 1, 2015). Variables used for person-level raking included: census region (Northeast, Midwest, South, West); MSA status (MSA, non-MSA); race/ethnicity (Hispanic; Black, non-Hispanic; Asian, non-Hispanic; and other); sex; and age. The final weight for key, responding persons who were not in-scope on December 31, 2014 but were in-scope earlier in the year was the person weight after the nonresponse adjustment.

### **3.2.2 MEPS Panel 19 Weight Development Process**

The person-level weight for MEPS Panel 19 was developed using the 2014 MEPS Round 1 person-level weight as a “base” weight. For key, in-scope members who joined an RU after Round 1, the Round 1 family weight served as a “base” weight. The weighting process included an adjustment for nonresponse over the remaining data collection rounds in 2014 as well as raking to the same population control figures for December 2014 used for the MEPS Panel 18 weights for key, responding persons in-scope on December 31, 2014. The same five variables employed for Panel 18 raking (census region, MSA status, race/ethnicity, sex, and age) were used for Panel 19 raking. Again, the final weight for key, responding persons who were not in-scope on December 31, 2014 but were in-scope earlier in the year was the person weight after the nonresponse adjustment.

Note that the MEPS Round 1 weights for both panels incorporated the following components: a weight reflecting the original household probability of selection for the NHIS and an adjustment for NHIS nonresponse; a factor representing the proportion of the 16 NHIS panel-quarter combinations eligible for MEPS; the oversampling of certain subgroups for MEPS among the NHIS household respondents eligible for MEPS; ratio-adjustment to NHIS-based national population estimates at the household (occupied DU) level; adjustment for nonresponse at the DU level for Round 1; and poststratification to U.S. civilian noninstitutionalized population estimates at the family and person level obtained from the corresponding March CPS databases.

### **3.2.3 The Final Weight for 2014**

The final raking of those in-scope at the end of the year has been described above. In addition, the composite weights of two groups of persons who were out-of-scope on December 31, 2014 were poststratified. Specifically, the weights of those who were in-scope some time during the year, out-of-scope on December 31, and entered a nursing home during the year were poststratified to a corresponding control total obtained from the 1996 MEPS Nursing Home Component. The weights of persons who died while in-scope during 2014 were poststratified to corresponding estimates derived using data obtained from the Medicare Current Beneficiary Survey (MCBS) and Vital Statistics information provided by the National Center for Health Statistics (NCHS). Separate decedent control totals were developed for the “65 and older” and “under 65” civilian noninstitutionalized populations.

Overall, the weighted population estimate for the civilian noninstitutionalized population for December 31, 2014 is 314,906,436 (PERWT14F>0 and INSC1231=1). The sum of the person-level weights across all persons assigned a positive person-level weight is 318,440,423.

### **3.2.4 Coverage**

The target population for MEPS in this file is the 2014 U.S. civilian noninstitutionalized population. However, the MEPS sampled households are a subsample of the NHIS households interviewed in 2012 (Panel 18) and 2013 (Panel 19). New households created after the NHIS interviews for the respective panels and consisting exclusively of persons who entered the target population after 2012 (Panel 18) or after 2013 (Panel 19) are not covered by MEPS. Neither are previously out-of-scope persons who join an existing household but are unrelated to the current household residents. Persons not covered by a given MEPS panel thus include some members of the following groups: immigrants, persons leaving the military, U.S. citizens returning from residence in another country, and persons leaving institutions. The set of uncovered persons constitutes only a small segment of the MEPS target population.

## **3.3 Using MEPS Data for Trend Analysis**

MEPS began in 1996, and the utility of the survey for analyzing health care trends expands with each additional year of data; however, there are a variety of methodological and statistical considerations when examining trends over time using MEPS. Examining changes over longer periods of time can provide a more complete picture of underlying trends. In particular, large shifts in survey estimates over short periods of time (e.g. from one year to the next) that are statistically significant should be interpreted with caution unless they are attributable to known factors such as changes in public policy, economic conditions, or survey methodology.

In 2013 MEPS survey operations introduced an effort to obtain more complete information about health care utilization from MEPS respondents with full implementation in 2014. This effort resulted in improved data quality and a reduction in underreporting in the second half of 2013 and throughout 2014. The impacts of these efforts are important to consider. Respondents reported more visits, especially non-physician visits, by sample members and the increase in the number of reported visits was especially large at the tail of the distribution. Consequently, there is a break in trend among people who are more likely to be in that tail, such as the elderly,

Medicare beneficiaries, and people with multiple chronic conditions, disabilities, or poor health. In turn, spending on visits also increased, especially in the tail and for these subgroups. These increases in service use and expenditures were not uniform throughout the country, and respondents in the West South Central Census Division reported less increase in use, especially for non-minority sample members. Data users comparing service use and expenditures across states, regions, or racial and ethnic groups, particularly before and after 2013, may take this lack of uniformity into account by working in data centers, which provide access to restricted data files containing the Census Division variable. See: [meps.ahrq.gov/data\\_stats/onsite\\_datacenter.jsp](http://meps.ahrq.gov/data_stats/onsite_datacenter.jsp)

Changes to the MEPS survey instrument should also be considered when analyzing trends. For example, as a result of improved methods for collecting priority conditions data implemented in 2007, prevalence measures prior to 2007 are not comparable to those from 2007 and beyond for many of these conditions. Data users should review relevant sections of the documentation for descriptions of these types of changes before undertaking trend analyses.

Analysts may also wish to consider using statistical techniques to smooth or stabilize analyses of trends using MEPS data such as comparing pooled time periods (e.g. 1996-97 versus 2012-13), working with moving averages or using modeling techniques with several consecutive years of MEPS data to test the fit of specified patterns over time.

Finally, statistical significance tests should be conducted to assess the likelihood that observed trends are not attributable to sampling variation. In addition, researchers should be aware of the impact of multiple comparisons on Type I error. Without making appropriate allowance for multiple comparisons, undertaking numerous statistical significance tests of trends increases the likelihood of concluding that a change has taken place when one has not.

#### **4.0 Merging/Linking MEPS Data Files**

Data from the current file can be used alone or in conjunction with other files. Merging characteristics of interest from person-level files expands the scope of potential estimates. See HC-168I for instructions on merging the Conditions File to the Medical Event Files. Person-level characteristics can be merged to this Conditions File using the following procedure:

1. Sort the person-level file by person identifier, DUPERSID. Keep only DUPERSID and the variables to be merged onto the Conditions File.
2. Sort the Conditions File by person identifier, DUPERSID.
3. Merge both files by DUPERSID, and output all records in the Conditions File.
4. If PERS contains the person-level variables, and COND is the Conditions File, the following code can be used to add person-level variables to the person's conditions in the Condition-level file.

```
PROC SORT DATA=PERS(KEEP=DUPERSID AGE SEX EDUYRDG
EDRECODE)
OUT=PERSX; BY DUPERSID;
```

```
RUN;  
  
PROC SORT DATA=COND; BY DUPERSID;  
RUN;  
  
DATA COND;  
MERGE COND (IN=A) PERSX(IN=B); BY DUPERSID;  
IF A;  
RUN;
```

#### **4.1 National Health Interview Survey (NHIS)**

Data from this file can be used alone or in conjunction with other files for different analytic purposes. Each MEPS panel can also be linked back to the previous years' National Health Interview Survey public use data files. For information on obtaining MEPS/NHIS link files please see [meps.ahrq.gov/data\\_stats/more\\_info\\_download\\_data\\_files.jsp](http://meps.ahrq.gov/data_stats/more_info_download_data_files.jsp).

#### **4.2 Longitudinal Analysis**

Panel-specific longitudinal files are available for downloading in the data section of the MEPS Web site. For each panel, the longitudinal file comprises MEPS survey data obtained in Rounds 1 through 5 of the panel and can be used to analyze changes over a two-year period. Variables in the file pertaining to survey administration, demographics, employment, health status, disability days, quality of care, patient satisfaction, health insurance, and medical care use and expenditures were obtained from the MEPS full-year Consolidated files from the two years covered by that panel.

**Appendix 3**  
**Clinical Classification Code to**  
**ICD-9-CM Code Crosswalk**

### Appendix 3 - Clinical Classification Software-DIAGNOSES (January 1980 through September 2014)

The following tables list the ICD-9-CM condition and V codes that have been aggregated for each clinical classification category. These clinical classification categories were generated using Clinical Classification Software provided on the Healthcare Cost and Utilization Project (HCUP) website. For each clinical classification category, one or more ICD-9-CM and/or V code is listed.

**List of Invalid ICD-9-CM Codes**

## LIST OF INVALID ICD-9-CM CODES

DIAGNOSIS CODE	DESCRIPTION
41.4	Escherichia coli [E. coli] infection in conditions classified elsewhere and of unspecified site
173	Other malignant neoplasm of skin of lip
173.1	Other malignant neoplasm of skin of eyelid, including canthus
173.2	Other malignant neoplasm of skin of ear and external auditory canal
173.3	Other malignant neoplasm of skin of other and unspecified parts of face
173.4	Other malignant neoplasm of scalp and skin of neck
173.5	Other malignant neoplasm of skin of trunk, except scrotum
173.6	Other malignant neoplasm of skin of upper limb, including shoulder
173.7	Other malignant neoplasm of skin of lower limb, including hip
173.8	Other malignant neoplasm of other specified sites of skin
173.9	Other malignant neoplasm of skin, site unspecified
284.1*	Pancytopenia
286.5	Hemorrhagic disorder due to intrinsic circulating anticoagulants
310.8	Other specified nonpsychotic mental disorders following organic brain damage
425.1*	Hypertrophic obstructive cardiomyopathy
444	Embolism and thrombosis of abdominal aorta
512.8*	Other spontaneous pneumothorax
516.3	Idiopathic fibrosing alveolitis
518.5*	Pulmonary insufficiency following trauma and surgery
596.8	Other specified disorders of bladder

<b>DIAGNOSIS CODE</b>	<b>DESCRIPTION</b>
631	Other abnormal product of conception
718.60*	Unspecified intrapelvic protrusion of acetabulum, site unspecified
747.3	Anomalies of pulmonary artery
793.1*	Nonspecific (abnormal) findings on radiological and other examination of lung field
795.5*	Nonspecific reaction to tuberculin skin test without active tuberculosis
997.4**	Digestive system complications
998.0*	Postoperative shock
999.4	Anaphylactic shock due to serum
999.5**	Other serum reaction
V12.2	Personal history of endocrine, metabolic, and immunity disorders
V13.8	Personal history of other specified diseases
V19.1	Family history of other eye disorders
V40.3*	Other behavioral problems

<b>PROCEDURE CODE</b>	<b>DESCRIPTION</b>
02.2*	Ventriculostomy

Notes:

\* These diagnosis codes were discussed at the March 9-10, 2011 ICD-9-CM Coordination and Maintenance Committee meeting and were not finalized in time to include in the FY 2012 IPPS/LTCH PPS proposed rule. They were deleted on October 1, 2011.

\*\* The code title has changed from the proposed rule.
